PROPOSED EXAMINER'S AMENDMENT

1. (currently amended) An image synthesis apparatus, comprising:

a right infrared camera and a left infrared camera;

a right visible light camera and a left visible light camera; and

a first image synthesis processing device for synthesizing data output from the right infrared camera and the left infrared camera and data output from the right visible light camera and the left visible light camera so that a three-dimensional thermal image and a three-dimensional visible light image are observed by an observer as overlapping each other,

wherein the three-dimensional thermal image comprises a plurality of color tones having a predetermined correspondence with a luminance represented by the data output from the right infrared camera and the data output by the left infrared camera,

wherein a temperature of a subject can be inferred by the observer based on the predetermined color correspondence.

10. (currently amended) An image synthesis apparatus, comprising:

a slit device including a plurality of slits;

an infrared directing device for directing infrared toward a subject through the slit device;

a plurality of infrared cameras provided in a direction substantially perpendicular to a direction in which the infrared is directed toward the subject;

a plurality of visible light cameras provided in a direction substantially perpendicular to a direction in which the visible light images a subject; and

an image synthesis processing device for synthesizing a plurality of thermal image data output from the plurality of infrared cameras so as to generate three-dimensional thermal image data, and

said image synthesis processing device synthesizing a plurality of visible light image data from the plurality of visible light cameras so as to generate three-dimensional visible light image data,

wherein the three-dimensional thermal image data comprises a plurality of color tones having a predetermined correspondence with a luminance represented by the data output from the plurality of infrared cameras,

wherein a temperature of the subject can be inferred by the observer based on the predetermined color correspondence.
